

DigiT — Configure Workspace

The full six-step setup, shown for all four workspaces · v1.0

This walks through every one of the six setup steps for each workspace. Note that **steps 1, 3, 4, 5 and 6 are the same shared screens** across all four workspaces — only the header colour, the step-rail labels and **Step 2 (Framework setup)** change. That is the point: you build the wizard shell once, and only the four step-2 panels are bespoke. Each workspace below carries its own accent colour (Compliance teal, Resources blue, Performance amber, Operational indigo).

DigiT — Configure Workspace: all six steps for all four workspaces · v1.0

Page 13

Recap

Across all four workspaces, the setup is the same guided six-step wizard. Five of the six steps — General, Data & integrations, Features & automations, Roles & access, Review & activate — are identical shared screens. The only bespoke work per workspace is the **Step 2 Framework panel** (Standards & Controls / Assets & Inventory / Metrics & KPIs / Intake & Recipes). And because the same six steps become a tabbed settings hub after launch, this one build also covers all post-launch reconfiguration. Build the shell once, drop in four panels, and the entire configuration layer is done for every workspace.
